ABSTRACT

A method for creating a picture that has two sides is described. The picture has an image with a bottom layer (2), a white middle layer (3) and a top layer (4). The single image that results, when printed on a transparent medium, presents one image when seen from the front and a different image when viewed from the back, through the transparent medium. The two sided image may be printed on a transparent medium as in Figs (2) and (4), or it may be printed on decal material and placed on a transparent object such as a glass as in (6) and (7). Two sided text may be added as in (8), (9) and (10). The two sided image may be combined with other two sided images as in (15) and (16). Two sided decals may be placed on plastic and cut out as in (17).
